Specifying Stone Veneers

TXTR-LITE is a new stone veneer that can be applied to many different indoor and outdoor surfaces. TXTR-LITE's light weight and flexibility allow it to be used in many applications including vertical and horizontal surfaces not previously considered for stone due to weight and / or flaking issues.

Composition

TXTR-LITE is natural stone veneer laminated to a fiberglass substrate.

Variations

Since TXTR-LITE is a natural stone veneer, color and texture variances are not defects within the material, but are inherent to it and part of the natural beauty of quarried materials. TXTR-LITE cannot be guaranteed to match dye-lot to dye-lot, so it is recommended that orders take into account future maintenance or re-fit possibilities.

TXTR-LITE is produced with a fiberglass backing. As a result, in certain instances, a seam will be noticeable when TXTR-LITE is used in backlit applications.

TXTR-LITE is perfect for wall applications, furniture, millwork, lighting column cladding and numerous other interior and exterior applications. TXTR-LITE is not recommended for flooring or countertop applications due to the thin soft nature of the stone veneer.

TXTR-LITE may be used in backlit or other translucency applications. Disclaimer: Most applications of this nature will require a custom panel manufactured without fiber and a computer color matched backer.

UV/temperature

The stone surface of TXTR-LITE, like most stone elements, acts as a UV inhibitor and will resist high sun conditions for years. When adhered to a substrate, TXTR-LITE will handle thermal contraction and or expansion of most standard construction materials. TXTR-LITE will handle both high temperatures and freezing without cracking.

Surfaces

TXTR-LITE can be applied to MDF, foam board, melamine, concrete, brick, block, drywall, plywood, acrylic and other plastic sheeting.

Cutting

The use of metal shears is recommended for cutting TXTR-LITE. However, standard carbide or diamond saw blades would work just as well.

TXTR-LITE can be bent in the same manner as plastic laminate products. The fiberglass strand used in the manufacture of TXTR-LITE gives it strength and flexibility. TXTR-LITE can be bent inward, or arched outward, depending on the desired need. TXTR-LITE can be bent or flexed to a radius of 18" along the 4' length. The 2' width will also have a slight flex to it, but is not recommended for bending. Due to the nature of the different thickness of the individual items, the degree of radius varies per item. We recommend testing the flex of the considered item prior to final installation.

Installation

TXTR-LITE can be glued using most standard laminate adhesives having a thick body or foaming quality. Prior to application, it is imperative to clean, brush and de-grease the receiving surface of dust, oils or any other contaminants. In some installations, and depending upon the adhesive used, it may be necessary to prep the back of the TXTR-LITE with solvent or recommended primer by the adhesive manufacturer. We recommend making a test area with any adhesive prior to final application.

Adhesives and adhesion

Understanding the specifics of adhesives, and the respective surfaces for which they are recommended, is critical in obtaining superior installations when using TXTR-LITE. We recommend testing the selected adhesive prior to proceeding with installation, taking into consideration the humidity and temperature of the planned environment. If the application is outdoors, consideration to thermal expansion should be taken into account. Since TXTR-LITE is a veneer, it must expand and contract the same as the substrate to which it is applied...or de-lamination may occur. Whenever a primer is recommended by the adhesive manufacturer, the bond must be tested by the installer prior to final installation.

Specifying Stone Veneers

Continued

Recommended types of adhesives & fillers:

- > Polyester-based gap filler putties (eg. Bondo and similar)
- > Epoxies
- > Silicone (with primer only)
- > Polyurethane wood glues
- > Thick latex-type adhesives, thin set etc. (Use ONLY where air-drying can take place)
- Construction grade multi-purpose adhesives (eg. Liquid Nails or PL Premium Polyurethane {stickwithpl.com} or similar)

Note: The back of TXTR-LITE veneers may require a filler-type adhesive in some cases. Polyurethane wood glues work well for most applications to board materials by foaming slightly to fill gaps. For wet environments such as shower and bathroom applications, the use of epoxy is best. Note: Contact adhesives are NOT recommended due to the uneven backing of TXTR-LITE veneer.

Tiling

TXTR-LITE can be used to create a tiled effect by leaving a grout joint between cut pieces of material. Test results have shown the use of water-based epoxy grouts work well to fill between the cut veneers. By removing the material just under the grout joint, a deeper grout can be achieved if desired. Epoxy grouts are available in many colors to match or co-ordinate with the different colors of TXTR-LITE. On final clean up of the epoxy with a sponge, the epoxy can also be used to seal and fill the TXTR-LITE surface. It is recommended in this installation that the entire surface of the TXTR-LITE be sealed with epoxy as a final step to ensure complete satisfaction.

Sealers

TXTR-LITE can be sealed in the same manner as most slate and / or stone tiles are. Please follow manufacturer's instructions for best results. As sealants are offered in varying degrees of luster or sheen, we recommend that you confirm the reflectance prior to complete installation to get the desired effect.

Technical analysis

Test Method: UŠ Code of Federal Regulations Part 1500.44, Title 16

Flammability test on rigid and pliable solids: Pass

Sample Burning Rate (inch/sec)

Polyester Resin Based Metalized Panel 0.004

Test Method: As specified in AOAC 16th Ed. Section 973.32 & 973.82 Polyester resin-based metalized panel/bowl

Lead & Cadmium content in earthenware quantilation by AAS: PASS

SGS Laboratory No 14324 14324 14324 14324 14324 14324	Extract, Volume (II) 2.0 2.0 2.0 2.0 2.0 2.0 2.0	Lead, ppm (mg/L) <1.0 <1.0 <1.0 <1.0 <1.0	Cadmium, ppm (mg/L) <0.25 <0.25 <0.25 <0.25 <0.25 <0.25	
Limit for FDA (any one of six)		1.0 ppm	0.25	
Notes: 1) < 2) mg/L 3) ppm 4) AAS	= parts per million	= milligrams per liter		

Conclusion: The client submitted samples described above comply with the leachable lead and cadmium requirements of the American Food and Drug Administration (FDA).

Test Method: Nitric Acid digestion and analyzed by Atomic Absorption Spectrophotometer.

Test Sample: 04249 Stone/Slate on Resin 12 x 12 tile size 6x

^{*}A sample is considered to have passed the test if the burning rate is not more than 0.10 inch per second.
