

Kwalu Rigid Wall Covering

1. Specify the height of the installation.
2. Specify the wood grain color required. The standard sheet size is 4' x 10', with the wood grain running with the 10' dimension. All orders will be cut in 4' long sections to the height specified, assuming a vertical wood grain orientation upon installation. If horizontal grain direction is required, it must be specified in your order and the material will be provided in 10' long sheets and cut to the specified height at the factory.
3. Specify the overall length, in feet, of the wall covering you require, or the sum total of all individual sections between ends and corners. We will add 10% to this number (multiply by 1.1) to allow for scrap produced during the installation, divide that number by the width of the sheet and round up to the next highest whole number to get the number of sheets required.
4. Specify the exact number of trim accessories required: for top and bottom caps, use the overall length of the installation, including the 10% allowance for scrap, and divide by the length of the trim pieces; for vertical trim, divide the height of the trim by the height of the sheet installation to calculate how many ends, joints or corners that each piece will cover. Round down to the next nearest whole number, then divide the total number of ends, joints or corners by that whole number.
5. Specify the number of gallons of adhesive required: divide the overall square feet of wall covering ordered, excluding the 10% allowance for scrap, by 125 square feet (the average square-foot coverage per gallon of adhesive).
6. Specify the number of tubes of color-matched caulk required: divide the total length of all joints to be covered by 100 linear feet (the average per-tube yield of color-matched caulk).
7. Specify whether or not extension pressure rollers should be included with the order.
8. Specify if you would like Kwalu to perform the installation, or if an independent installer will be used.
