

EXTREME IMPACT GYPSUM BOARD

CERTAINTEED GYPSUM

PALATKA, FL

The Certainteed Extreme Impact Advantage:

- Fire ratings up to four hours
- Enhanced mold and moisture protection
- Consistently high quality
- Uniformly flat, attractive appearance, no shadows
- High edge hardness
- No wavy edges, warps, bows or deformities
- Uniform high strength cores eliminate crumbling and cracking
- Edge tapers consistent to form perfect joints
- Excellent thermal barrier and sound attenuation qualities

Architects, contractors and manufacturers continue to look for ways to reduce our industry's impacts on the environment while meeting customer demand for products that deliver beauty, comfort and performance. Certainteed Gypsum, the leader in innovative drywall and performance wallboards, has the products to make your property healthier, quieter and more comfortable.

Certainteed Gypsum operates its manufacturing facilities with a responsible and environmentally conscious ethic that includes reclamation, preservation of natural resources, recycling and waste management. Certainteed, and Saint-Gobain, are committed to providing sustainable building products and to limiting our impacts on the environment while doing so. (See our CSR at <https://www.saint-gobain.com/en/commitments/saint-gobains-csr-commitments>.)

ENVIRONMENTAL PRODUCT DECLARATION

Extreme Impact Gypsum Board
Palatka, FL

According to ISO 14025/44/40 Series and ISO 21930

This declaration is an environmental product declaration (EPD) in accordance with ISO 14025. EPDs rely on Life Cycle Assessment (LCA) to provide information on several environmental impacts of products over their life cycle. Exclusions: EPDs do not indicate that any environmental or social performance benchmarks are met, and there may be impacts that they do not encompass. LCAs do not typically address the site-specific environmental impacts of raw material extraction, nor are they meant to assess human health toxicity. EPDs can complement but cannot replace tools and certifications that are designed to address these impacts and/or set performance thresholds – e.g., Type 1 certifications, health assessments and declarations, environmental impact assessments, etc. Accuracy of Results: EPDs regularly rely on estimations of impacts, and the level of accuracy in estimation of effect differs for any product line and reported impact. Comparability: EPDs are not comparative assertions and are either not comparable or have limited comparability when they cover different life cycle stages, are based on different product category rules or are missing relevant environmental impacts. EPDs from different programs may not be comparable.

Product Documentation

Product Description

Extreme Impact Resistant Gypsum Board with M2Tech® is for use in interior wall and ceiling applications that require high impact durability and enhanced moisture and mold resistance. Extreme Impact contains fiberglass mesh reinforcement within a specially formulated, dense, fire resistive, noncombustible, moisture resistant core enclosed in a 100% recycled moisture and mold resistant face and back paper. This combination affords greater resistance to abuse and sound transmission in high traffic areas than does standard gypsum board. The Extreme Impact Resistant Gypsum Board is also made with proprietary M2Tech® technology which improves indoor air quality by providing enhanced moisture and mold resistance.

The CertainTeed Extreme Impact Advantage:

- Fire ratings up to four hours
- Enhanced mold and moisture protection
- Consistently high quality
- Uniformly flat, attractive appearance, no shadows
- High edge hardness
- No wavy edges, warps, bows or deformities
- Uniform high-strength cores eliminate crumbling and cracking
- Edge tapers consistent to form perfect joints
- Excellent thermal barrier and sound attenuation qualities

Application

Gypsum board products provide multiple functions including wall covering, creating a barrier that controls noise, air, water and thermal transmission between the external environment and the interior space of a building, as well as other functions such as load carrying capacity, thermal mass and aesthetics.

Description of Organization

This EPD is specific to the Extreme Impact Gypsum Board manufactured at the CertainTeed Gypsum facility in Palatka, FL.

- CertainTeed Gypsum
886 North Highway 17
Palatka, FL 32177

The Palatka, FL manufacturing facility operates integrated Environmental, Health, and Safety Management Systems that align with the ISO 14001 and ISO 45001 standards.

Flow Diagram

Figure 1: Life Cycle Boundary Flow Diagram

Material Content

Component	Extreme Impact
Internally recycled Gypsum	2.81%
Synthetic Gypsum	90.77%
Fiberglass	0.35%
Starch	0.26%
Silicone	0.42%
Scrim	1.04%
Additives	0.44%
Paper facings	3.92%
Total kg/FU:	1306

Table 3: Material Content for CertainTeed Extreme Impact Gypsum Board

Synthetic (FGD) gypsum is a co-product of the coal-fired power generation process and is treated as a waste material of the coal-fired power generation process. The system boundary for North American gypsum panel products does not include the production of electricity from coal-fired power plants that produce FGD gypsum. Therefore, FGD

ENVIRONMENTAL PRODUCT DECLARATION

Extreme Impact Gypsum Board

According to ISO 14025/44/40 Series and ISO 21930

gypsum is considered a waste material input to the product system and is considered burden free, as stated in the PCR.

Methodological Framework

Functional Unit

Functional Unit = 92.9 m ² (1000 ft ²)		
Product	Mass (kg/FU)	Thickness (cm)
Extreme Impact Gypsum Board	1306	1.5875 cm (5/8")

Table 4: Functional Unit

Reference Service Life

The Reference Service Life used in the study is 75 years, as specified in the PCR.

System Boundary

The life cycle analysis performed for this EPD is classified as a “cradle-to-grave” study. The system boundary includes raw material supply, manufacture, and transport; the Extreme Impact Gypsum Board manufacture in Palatka, FL and packaging; product transportation to building site; installation; use phase, and product end-of-life.

Description of the System Boundary (X=included in LCA; MND=module not declared)																
Product Stage			Construction Process Stage		Use Stage							End of Life Stage				Benefits & Loads Beyond System Boundaries
Raw Material Supply	Transport	Manufacturing	Transport from the gate to the site	Installation	Use	Maintenance	Repair	Replacement	Refurbishment	Operational Energy Use	Operational Water Use	De-construction demolition	Transport	Waste Processing	Disposal	Reuse-Recover-Recycling Potential

Allocation

There are several facilities in the United States and Canada that produce gypsum board product lines for CertainTeed. Each of the facilities produces multiple types of gypsum board. Allocation within each facility was conducted based on the machine hour run time production data provided by the facilities and the central CertainTeed Gypsum product team. This EPD is specific to the Extreme Impact Gypsum Board produced at the Palatka, FL facility.

Cut-Off Criteria

The cut-off criteria established for the study include materials, energy, and emissions data. For the purposes of this study, the criteria are as follows:

- Mass – Chemicals with a combined weight less than 1% of the mass of the modeled product may be excluded, providing its environmental relevance is not a concern.
- Hazardous substances as defined by the U.S. Resource Conservation and Recovery Act (RCRA), will be included if representing more than 0.1% of the product composition.
- Human activity factors were not included in the scope of this study.
- Capital equipment factors were not included in the scope of this study.

Data Sources

GaBi version 9.2 software system was used for modeling the life cycle of the CertainTeed Extreme Impact Gypsum Board products. Each background dataset was taken from the GaBi Thinkstep US Ecoinvent, USLCI databases, and Ecoinvent v3.

Data Quality

Wherever secondary data is used, the study adopts critically reviewed data for consistency, precision, and reproducibility to limit uncertainty. The data sources used are complete and representative of North America and Europe (depending on the material source) in terms of the geographic and technological coverage and are less than 10 years old. Any deviations from these initial data quality requirements for secondary data are documented in the report. Overall, the primary data from the manufacturing location is of very high quality, being directly tracked and measured by facility personnel. Secondary data sets are of fair-to-good quality.

Period Under Review

Data for this LCA was collected for the 2019 calendar year.

ENVIRONMENTAL PRODUCT DECLARATION

Extreme Impact Gypsum Board
Palatka, FL

According to ISO 14025/44/40 Series and ISO 21930

Estimates and Assumptions

Estimates and assumptions are required in life cycle analysis to constrain the project boundary or model when little or not data is available. In this study of CertainTeed Extreme Impact Gypsum Board, any estimates or assumptions made are appropriately documented in the background report.

Comparability

Comparison of the environmental performance of building and construction products using EPD information shall be based on the product's use and impacts at the building level. In general, EPDs may not be used for comparability purposes when not considered in a building context. As noted in the PCR, only EPDs generated from cradle-to-grave life cycle results and based on the same function, RSL, quantified by the same functional unit, and meeting all the conditions for comparability listed in ISO 14025:2006 and ISO 21930:2017 can be used to compare between products.

Technical Information and Scenarios

Manufacturing (A3)

The process begins with internally recycled gypsum material added to the synthetic gypsum raw material. Water is then added to produce a stucco slurry. Additional additives are mixed with the slurry as indicated by the specific product recipe. Large rolls of the facing and backing paper are loaded onto spools that feed the manufacturing line. The backing paper is fed through first, the slurry is applied to the backing paper, and then the facing paper is fed through the line and applied on top of the slurry. The wet board is fed through rollers to ensure proper thickness and allow the material set. The boards are then cut to length and aligned for processing through the ovens for the remainder of the drying process. After drying in the ovens, the boards are stacked by two, with end tape applied for shipping.

Extreme Impact Gypsum Board
Palatka, FL

According to ISO 14025/44/40 Series and ISO 21930

Figure 2: Gypsum Board Manufacturing Diagram

Packaging (A3)

Packaging of the final product after production is included in the life cycle assessment. Packaging material includes the end tape applied at the end of the manufacturing process, as well as spacers used to stack the boards at varying heights for easier loading and unloading, and plastic film tarping. The spacers used in the packaging are made at the manufacturing facility using rejected boards from the manufacturing process.

Transportation (A4)

Final products are transported via truck throughout North America. Distances and modes of transport for final product transportation are specified in the PCR.

Information	Unit	Value
Type of transport	Product shipping to distribution center	
Type of vehicle	Commercial tractor-trailer truck	
Distance	km	448
Fuel type	Diesel	
Amount of fuel	liters	1792 (4 L/km)
Information	Unit	Value
Type of transport	Product shipping to distribution center

Type of vehicle	Single unit truck	
Distance	km	40
Fuel type	Diesel	
Amount of fuel	liters	160 (4 L/km)

Table 6: Final Product Transportation (A4)

Installation (A5)

The Gypsum Panel PCR specifies the default on-site installation waste scenario is 10% of the installed surface area. The PCR also specifies ancillary materials required for installation of gypsum panels as joint compound, joint tape, and fasteners. This study used the installation calculator located on the CertainTeed Gypsum website to calculate the amount of ancillary materials required for installation. In addition, disposal of the packaging material is included in the installation phase.

Installation (A5)	Unit	Extreme Impact
Product loss	kg	130.6
Ancillary materials	kg	60.573
Joint Compound	kg	56.70
Joint Tape	kg	0.873
Fasteners	kg	3.00
Electricity consumption	kWh	0
Other energy consumption	kWh	0
Water consumption	m ³	0
Direct emissions to ambient air, soil, and water	kg	0
Waste materials as output from installation process	kg	130.6

Table 8: Packaging Waste (A5)

Use (B1-B7)

As specified in the PCR, gypsum panel products are assumed to have no material or energy inputs or emissions during the use (B1), maintenance (B2), repair (B3), replacement (B4), or refurbishment (B5) life cycle stages. The PCR also specifies that gypsum panel products are assumed to have no operational energy use (B6) and no operational water use (B7) during the use phase of the life cycle.

End of Life (C1-C4)

The PCR supports the scenario for industry practices that all gypsum panel products shall be disposed in an appropriate construction and demolition landfill at the end of life. At this time, there are no known scenarios for the deconstruction of gypsum boards from the building at the end of life, although the PCR requires inclusion of the energy required for deconstruction and dust released in the air. The deconstruction module (C1) for this study is assumed to use 0.05 MJ of energy in order to be consistent with previous CertainTeed Gypsum Board studies. At this time, there is no known method for distinguishing gypsum board dust from the overall dust generated in the demolition of a building, so the deconstruction module assumed no dust generated. The PCR also specifies the assumption that no gypsum panel waste goes to a waste processing facility prior to disposal in a landfill, so the waste processing module (Module C3) is assumed to be burden free. The product's end-of-life disposition is assumed to be inert in a landfill per the PCR. Disposal in an appropriate construction and demolition landfill or in commercial incineration facilities is permissible and should be done in accordance with local, provincial, and federal regulations.

LCA Interpretation

Based on the results from the life cycle assessment model, the life cycle impacts are strongly driven by the manufacture. The impacts of the manufacture are primarily attributed to the natural gas usage needed for the ovens to dry the boards. The natural gas usage in the manufacture accounts for as much as 52% of the cradle-to-grave environmental impact potentials for CertainTeed Extreme Impact Gypsum Boards at the Palatka, FL facility.

The manufacturing of gypsum board (A3) has the highest contribution to Global Warming Potential impacts. The use of internally recycled gypsum material helps to reduce the overall environmental impact potentials by reducing the amount of external raw materials needed for the process.

Another potentially significant contributor to the overall environmental impact results is seen in the results for the installation of the Gypsum Boards. The installation waste accounts for the majority of the impacts for installation. The PCR requires the use of a 10% installation waste scenario in the absence of actual data. As there is currently no actual installation data available, and because installation techniques may vary widely among installers, CertainTeed has little to no influence on the installation impacts.

Additional Environmental Information

Environment and Health During Manufacture

CertainTeed and Saint-Gobain have well-established Environmental, Health, and Safety (EHS) and product stewardship programs, which help to enforce proper evaluation and monitoring of chemicals and raw materials chosen to manufacture products. These programs ensure that all environmental and OSHA requirements are met or exceeded to ensure the health and safety of all employees and contractors.

The Palatka, FL CertainTeed Gypsum manufacturing facility operates integrated Environmental, Health, and Safety Management Systems that align with the ISO 14001 and ISO 45001 standards.
