Detail C - Bench-to-Storage Position

Tabletop Operation

To Flip Down for Bench

1. Lift up and pull at the center of the table top closest to the bench to unlock, then rotate the tabletop down until cross-tube support rests against the vertical leg support and the worksurface becomes the backrest. (Figures 1 & 2, Details A & B).

To Flip Up for Table

1. Lift up on the front edge of table top at the center and rotate up until the top is horizontal and drops into the locked position (Detail A).

Bench Storage/Transport Position

1. To store or transport unit, lift up on bench, rotating the bench to the vertical position (Figure 3 & Detail C).

Locking Casters

1. Lock casters to use bench/table. Unlock casters to transport table (Figure 1).

Ganging Tables

1. To gang tables together, first make certain that the tabletops are locked into the upright position and move tables together, with benches to the outside. Align the feet of the table bases and locate the sliding foot ganger on the foot (Figures 4 & 5).

Note: There will be approximately a 1/2" gap between tabletops when ganged to avoid finger pinching.

Caution: Keep hands from between tops and legs when moving tables together.

2. Lift up and slide the ganger from the stored position of one table foot, engaging onto the foot of the second unit, interlocking the hole in the ganger over the acorn nut on the second table leg. Repeat procedure at other end of the table (Figure 6).

Storage Position

1. When tables are to be separated, lift up and slide the ganger back to the stored position at both ends of table pair, then move tables apart (Figure 5).
